

Clean Reinstall Java 1.8 & OceanView

Notes:

- `~/Library/LaunchAgents` only shows currently active agents
 - `~/backup imgs/` has the compatible .dmg(s)
 - `\` escapes spaces in file path; can also wrap the path in quotes ""
 - `~` refers to userspace
 - `/` before a path = Absolute path from root (vs `~/` being relative to the user account)
 - Below: grey highlights are one continuous command
-

In Terminal:

Delete Java

1. `mv ~/Library/LaunchAgents/setenv.java.plist ~/setenv.java.plist.disabled`
 - a. Temporarily move the rule to avoid weirdness (hardcoded jdk 1.8)
 - b. If it doesn't exist (i.e. if hard drive wiped) skip this step
2. https://www.java.com/en/uninstall/uninstall_instructions.html#macOS
 - a. `sudo rm -rf /Library/Internet\ Plug-Ins/JavaAppletPlugin.plugin`
 - b. `sudo rm -rf /Library/PreferencePanes/JavaControlPanel.prefPane`
 - c. `sudo rm -rf ~/Library/Application\ Support/Oracle/Java` // java cache
 - d. `sudo rm -rf /Library/Java/JavaVirtualMachines/*`
3. `pkgutil --pkgs | grep -E 'oracle|jdk'`
 - a. `sudo pkgutil --forget com.oracle.jdk-whatever` // del all remaining refs

Reinstall Java

4. For OceanView 2.0.20 Mac:
 - a. FAQ says JDK 1.8; latest manual doesn't specify
1.8's API structurally different than 21 LTS or 24
 - b. Download jdk8u202 (or from `~/backup imgs/`) – double click the .dmg to mount it
 - i. Don't run the installer, JavaAppletPlugin is deprecated and the installer will fail
 - c. `pkgutil --expand-full /Volumes/"JDK 8 Update 202/JDK 8 Update 202.pkg" /tmp/jdk`
 - d. `sudo cp -R "/tmp/jdk/jdk180_202.pkg/Payload"
/Library/Java/JavaVirtualMachines/jdk1.8.0_202.jdk`
 - e. Check install with `/usr/libexec/java_home -V`
`1.8.202.08 "Java" /Library/Internet Plug-Ins/JavaAppletPlugin.plugin/Contents/Home`
`1.8.0_202 "Java SE 8" /Library/Java/JavaVirtualMachines/jdk1.8.0_202.jdk/Contents/Home`
 - f. Can probably remove the new JavaAppletPlugin too since deprecated, but I left it
 - g. `mv ~/setenv.java.plist.disabled ~/Library/LaunchAgents/setenv.java.plist`
If it doesn't exist:
 1. `touch ~/setenv.java.plist` → `nano ~/setenv.java.plist`

2. Paste the script from the last page starting at `<?xml`
3. `Ctrl+X`, `Y`, `Enter` to save
 - ii. `mv ~/setenv.java.plist ~/Library/LaunchAgents/setenv.java.plist`
 - iii. Reboot to ensure that the LaunchAgent is properly enabled
- h. `touch ~/.zshrc` → `nano ~/.zshrc` → add or make sure they exist (1 per line):
 - i. `export JAVA_HOME=$(/usr/libexec/java_home -v 1.8.0_202)`
ensure -v flag if > 1 entry (targeting the one in /Library/Java/JavaVirtualMachines)
 - ii. `export PATH=$JAVA_HOME/bin:$PATH`
- i. Restart terminal, check proper globals registered:
 - i. `echo $JAVA_HOME`
 - ii. `echo $PATH | grep jdk`

Install OceanView

5. Install OceanView 2.0.20
 - a. OceanViewSetup runs / works from the mounted .dmg, but mounts are ephemeral
Need to install permanently
 - b. `mkdir -p /tmp/ov/`
 - c. Dbl click the .dmg to mount it, close the launcher
 - d. `sudo cp -R /Volumes/OceanViewSetup/ /tmp/ov/`
 - e. `sudo mv /tmp/ov/OceanView.app /Applications/`
 - f. Finder -> Eject
 - g. Open Finder → Applications → Select OceanView → Make Alias → Drag to Desktop
 - i. Don't move the main OceanView(.app) or it'll break

~/Library/LaunchAgent/setenv.java.plist

~/.zshrc will persist globals within the terminal, but the LaunchAgent is required to persist globals for GUI apps and runs in the background (System Settings → General → Login Items (unsigned launchctl))

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE plist PUBLIC "-//Apple//DTD PLIST 1.0//EN" "http://www.apple.com/DTDs/PropertyList-1.0.dtd">
